ProLogix Sortation Controls

Proper control of a sorter is key to maximizing equipment performance and reliability. The ProLogix Sortation control package is designed to optimize performance and efficiency of all Hytrol Sortation products. ProLogix provides total control of not only product tracking but also sorter performance and diagnostics including certain predictive maintenance instructions

Interfacing is accomplished through touch screens with user-friendly menus that are standard with multiple languages selectable with the touch of a button. ProLogix is designed to be easily integrated into any system and utilizes proven software that is simply configured for your application. Maximize performance and system up-time and minimize maintenance of any sorter with Hytrol's proven sortation control.

ZipLogix

The ZipLogix control package provides flexible and complete control when combining multiple conveyor lines into one line. ZipLogix can be configured for 2-to-1, 3-to-1, and 4-to-1 combining applications.

GapLogix

Hytrol's GapLogix is a standard control package designed for Hytrol's Gapper L. The Gapper L consists of two short belt units which are slaved together. The Gapper system automatically sets the gap and pitch between products. GapLogix optimizes the performance of a sortation system by reducing wasted space due to excess gaps between large products. This allows system throughput requirements to be achieved at lower conveyor speeds.

Plug-N-Go

Hytrol's patented Plug-N-Go wiring system is specifically designed to provide the simplest and most reliable wiring solution for the ProLogix sortation control. Plug-N-Go provides quick-connect wiring to all devices on the sorter with all the benefits of speed and accuracy of operation. And it's even match-marked for quick and simple installation.

All Hytrol control packages have proven performance records and are fully supported by Hytrol's in-house control specialists
